Synthetic Dispatch Intervention Trial

The dispatch intervention group included 100 synthetic orders, and the control group included 100 orders.

Successful delivery rates were 92 percent in the intervention group and 89 percent in the control group.

Mean scan-to-door times were 17 minutes for the intervention group and 18.5 minutes for the control group.

The reported confidence interval crossed zero, so the authors did not establish a statistically reliable improvement.

The report did not break outcomes down by city or weather conditions.
